COVID-19 Tests

PCR tests, the most common type of test for COVID-19 have been shown to be up to 37% inaccurate^[1]. According to Anthony Fauci the PCR Test is “useless” when ran at a “cycle threshold” of 35 or more^[2]. The FDA recommends the test be ran at up to 40 cycles^[2].

The inventor of the PCR test, who was awarded a Nobel Prize in Chemistry, has stated the test was never intended to be used for infectious diseases and that “with PCR if you do it well you can find almost anything in anybody”^[3]. Case in point, Coca-Cola has tested positive for COVID-19^[4].

Antigen tests have also been shown to be wildly unreliable. For example, Elon Musk took four antigen tests in one day with two coming back positive and two coming back negative^[5].

The former chief science officer at PFizer has stated the “pandemic is over” and the “second wave” is based on false-positive COVID tests^[6].

Overwhelmed Hospitals

This data is hard to find and vet.

There's a lot of low quality conflicting information out there. South Dakota Governor Kristi Noem has shed some light on this issue, though. CBS ran a COVID fear piece on South Dakota's Hospitals and the governor rebutted their hysteria with the facts. Less than 20% of their hospital patients have COVID-19 and 40% of their beds are empty as of Dec 1st 2020.

Ohio has similar numbers with 18.47% of beds going to COVID-19 patients and 27% empty:

So what is the ideal hospital occupancy rate? According to hospitalmedicaldirector.com around 75-85% which actually puts both South Dakota's and Ohio's Hospitals under capacity.

Child Sacrifice

This graph shows covid deaths by age range:

School age children account for approximately 0% of COVID-19 deaths^[1]. Yet throughout the course of their lives they will pay the biggest price for all of this.

The Journal Of The American Medical Association calculates that 5,530,000 life years may be lost as a result of school closures. Had schools remained open, 1,470,000 life years lost could have been expected as a result, based on results of studies associating school closure with decreased pandemic spread^[2].

If that trade were not abhorrent enough the switch to virtual learning disproportionately affects disadvantaged students who are less pressured to show up to class and whose families cannot afford the equipment required for remote learning^{[3][4][5]}.

This says nothing about taking away one of their primary forms of social skill development of which the long-term effects could be devastating for our country.

Masks

Where to begin with masks? Do they work? Is that even the right question to be asking? The debate about whether or not they work misses the more fundamental point of whether or not there is a need to resort to what is most likely pseudoscientific desperation. Given the death rates I'd say absolutely not. It horrifies me to imagine how people would behave in a real emergency if this is how people handle something with a 99.5+% survival rate. Then again it seems like people take their cues from the media and authority figures more than thinking things through for themselves. Will you surrender for just one more moment of a comfortable life even if that means sowing the seeds of subjugation for generations to come? Ah, who am I talking to. You can't hear me. Let's look at some graphs.

These graphs show when mask mandates were implemented and their effect on the spread of COVID-19:

we even should take the extreme action of resorting to pseudoscience.

Why am I being harassed about wearing a mask again? Ah yes, because COVID-19 has an asymptomatic phase and I might be in that asymptomatic phase and by making every person in the country wear a mask and stay away from each other we can control the spread of a virus.

and even though the virus is smaller than the holes in the mask even though Anthony Fauci said masks don't work and asymptomatic people have never been the driver of an outbreak
